

Egret

Advanced information

Egret is an 8 channel D/A converter with a stereo mixer. The stereo mixer has level, cue send, and a pan control on each channel. Each channel also contains a solo and mute button. Egret has a master level control, a master cue send control and a headphone output with it's own level control. Each channel has a TRS insert and direct balanced outputs. The D/A converters support sample rates up to 192K and have sample rate converters on each channel for input jitter reduction. There is a front panel switch to disable the SRC for cases where low latency is required. The converters can also be used independently even at different sample rates.

The expected release is late spring 2005. If there are enough requests an up or down scaled version may be possible
